◆ “Nuclear DFT (density functional theory) with proton-neutron pairing and its application”
(e.g. GT transition in r-process)

- Proton-neutron (p-n) pairing: Goodman, Adv. Nucl. Phys.11, (1979) 293.

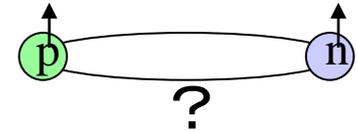

Pairing between protons and neutrons (isoscalar $T=0$ and isovector $T=1$)

Related (?) physics:

Wigner energy, β decays, interplay between $T=0$ and $T=1$ states in $N=Z$ nuclei, isospin mixing and mirror symmetry breaking, α decay and α clustering, moments of inertia, deformation properties, etc.

Perlinska et al, PRC 69, 014316(2004)

For a review on p - n pairing, see A. Afanasjev, arXiv:1205.2134

- Proton-neutron mixing:

Quasiparticles are mixtures of protons and neutrons

Density functionals with an arbitrary mixing between protons and neutrons

$$\rho_{\tau}(\alpha, \beta) = \langle \Psi | c_{\alpha, \tau}^{\dagger} c_{\beta, \tau} | \Psi \rangle \longrightarrow \rho_{\tau \tau'}(\alpha, \beta) = \langle \Psi | c_{\alpha, \tau}^{\dagger} c_{\beta, \tau'} | \Psi \rangle$$

$\tau = p, n$ $\tau, \tau' = p, n$

As a first step, we consider p-n mixing at the Hartree-Fock level without pairing.

Hartree-Fock calculation including proton-neutron mixing

- Extension of the single particle states

$$\begin{aligned}
 |\psi_{i,n}\rangle &= \sum_{\alpha} a_{i,\alpha}^{(n)} |\alpha, n\rangle \\
 |\psi_{j,p}\rangle &= \sum_{\alpha} a_{j,\alpha}^{(p)} |\alpha, p\rangle
 \end{aligned}
 \longrightarrow
 \begin{aligned}
 |\psi_i\rangle &= \sum_{\alpha} a_{i,\alpha}^{(n)} |\alpha, n\rangle + \sum_{\beta} a_{i,\beta}^{(p)} |\beta, p\rangle
 \end{aligned}
 \quad i=1, \dots, A$$

- Extension of the density functional

$$E^{Skyrme}[\rho_n, \rho_p] \longrightarrow E^{Skyrme'}[\rho_0, \vec{\rho}]$$

isoscalar
isovector

Invariant under rotation in isospin space

Perlinska et al, PRC 69 , 014316(2004)

can be written in terms of ρ_0, ρ_3

not invariant under rotation in isospin space

$$\begin{aligned}
 \rho_0 &= \rho_n + \rho_p & \rho_1 &= \rho_{np} + \rho_{pn} \\
 \rho_2 &= -i\rho_{np} + i\rho_{pn} \\
 \rho_3 &= \rho_n - \rho_p
 \end{aligned}$$

**Energy density functional is extended
such that it becomes invariant under rotation in isospin space**

Hartree-Fock calculation including proton-neutron mixing

- Extension of the single particle states

$$\begin{aligned}
 |\psi_{i,n}\rangle &= \sum_{\alpha} a_{i,\alpha}^{(n)} |\alpha, n\rangle \\
 |\psi_{j,p}\rangle &= \sum_{\alpha} a_{j,\alpha}^{(p)} |\alpha, p\rangle
 \end{aligned}
 \longrightarrow
 \begin{aligned}
 |\psi_i\rangle &= \sum_{\alpha} a_{i,\alpha}^{(n)} |\alpha, n\rangle + \sum_{\beta} a_{i,\beta}^{(p)} |\beta, p\rangle
 \end{aligned}
 \quad i=1, \dots, A$$

- Extension of the density functional

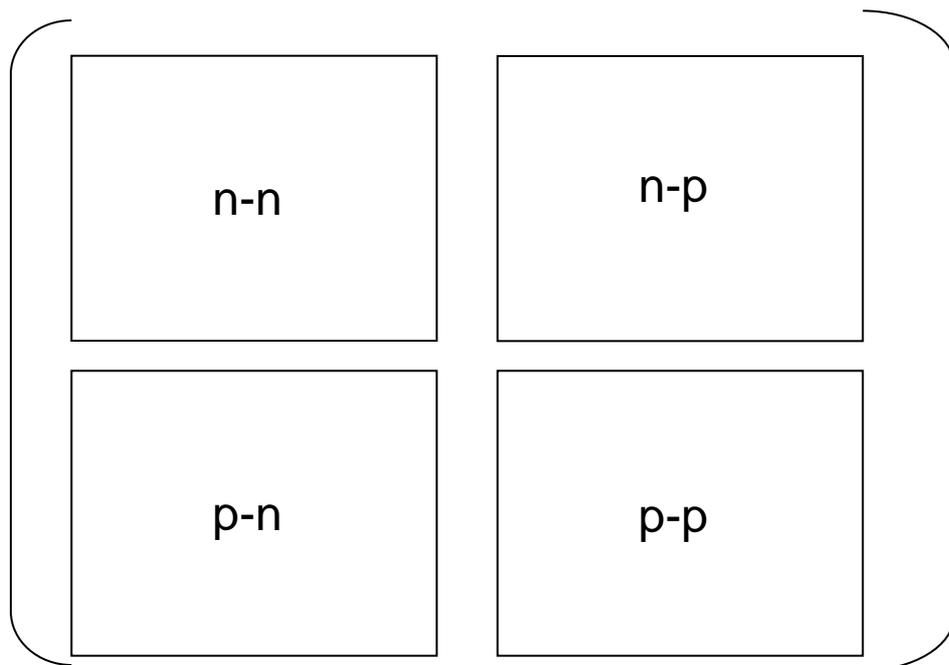

$$E^{Skyrme}[\rho_n, \rho_p] \longrightarrow E^{Skyrme'}[\rho_0, \vec{\rho}] \quad \text{Invariant under rotation in isospace}$$

isoscalar
isovector

Perlinska et al, PRC 69 , 014316(2004)

- p-n mixed Hartree-Fock Hamiltonian :

$$h_n, h_p \longrightarrow h_{mixed} =$$

Off-diagonal blocks are zero in the normal HF w/o p-n mixing

It is a hard task to develop a code from scratch ...

- Skyrme energy density functional
- Hartree-Fock or Hartree-Fock-Bogoliubov
- No spatial & time-reversal symmetry restriction
- Harmonic-oscillator basis
- Multi-function (constrained HFB, cranking, angular mom. projection, isospin projection, finite temperature....)

Road map

HFODD (Skyrme-HF(B) code)

Proton-neutron mixing at HF level

→ **Test calc. for A=14 and 48 nuclei**

Isospin projection with p-n mixing

to remove spurious isospin mixing

Proton-neutron pairing (T=1 & T=0)

QRPA with FAM, Isospin projection w/ p-n pairing, etc.

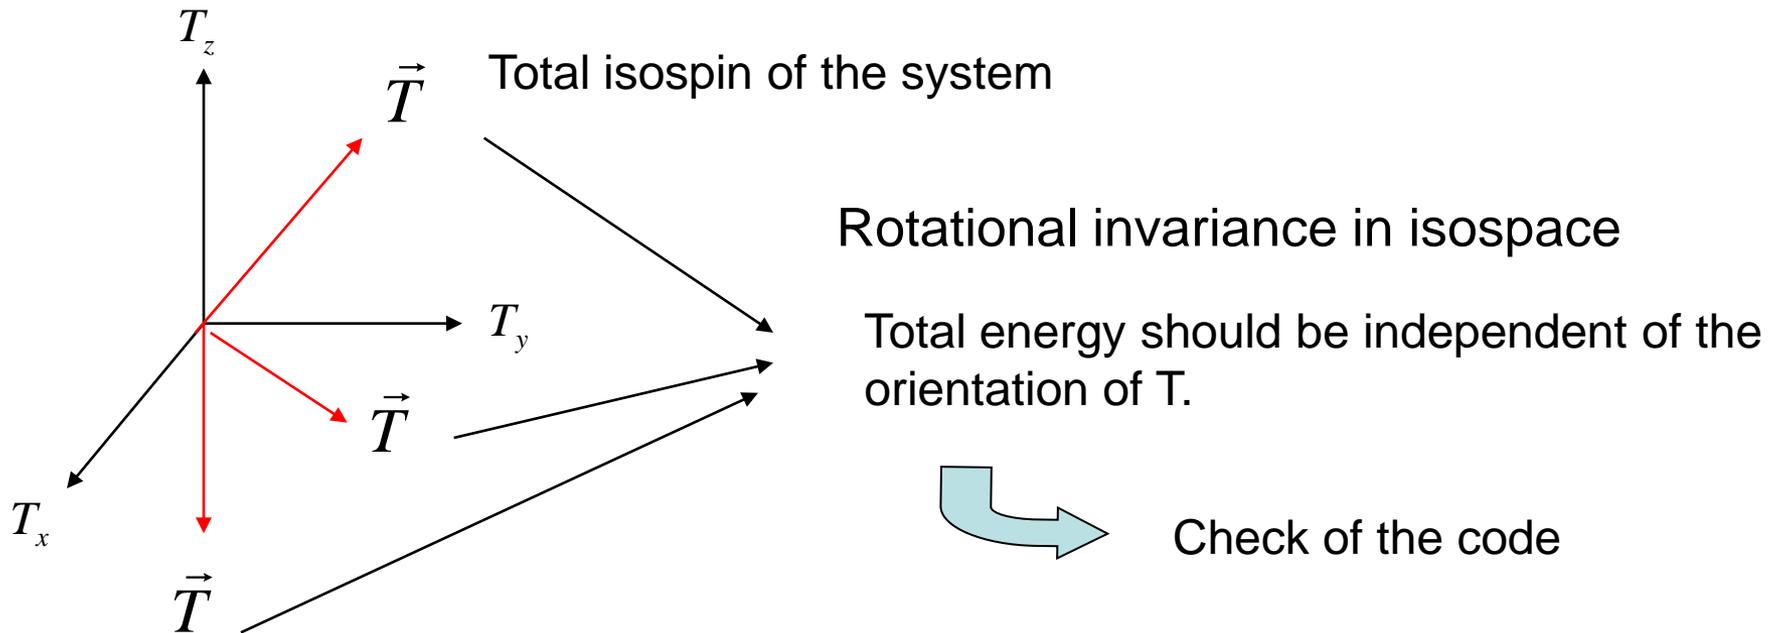

e.g. calc. of GT strengths of n-rich nuclei

Test calculations for p-n mixing

EDF with p-n mixing is correctly implemented?

w/o Coulomb force (and w/ equal proton and neutron masses)

$$\mathcal{H} = \mathcal{H}_{\text{kin}} + \mathcal{H}_{\text{Skyrme}} \quad \text{:invariant under rotation in isospin space}$$

How to control the isospin direction ?

Isocranking calculation

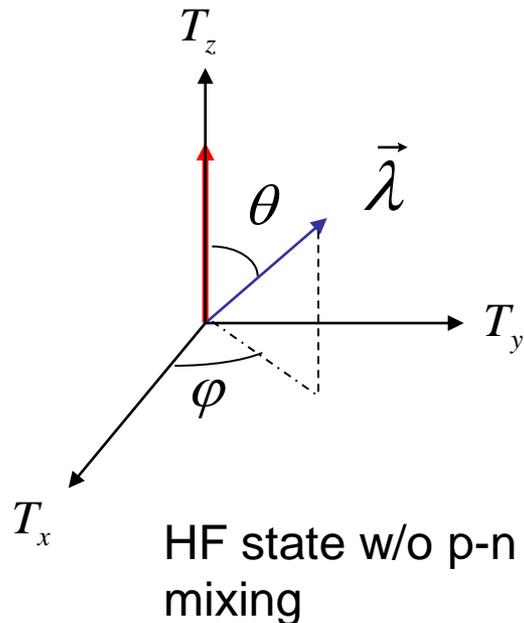

$$\hat{H}' = \hat{H} - \vec{\lambda} \cdot \vec{T} \quad \text{Isocranking term}$$

$\vec{\lambda}$: Input frequency to control the isospin of the system

HF eq. solved by iterative diagonalization of MF Hamiltonian.

w/ p-n mixing and no Coulomb

Initial state: HF solution w/o p-n mixing (e.g. $^{14}\text{C}(T_z=1, T_x=1)$)

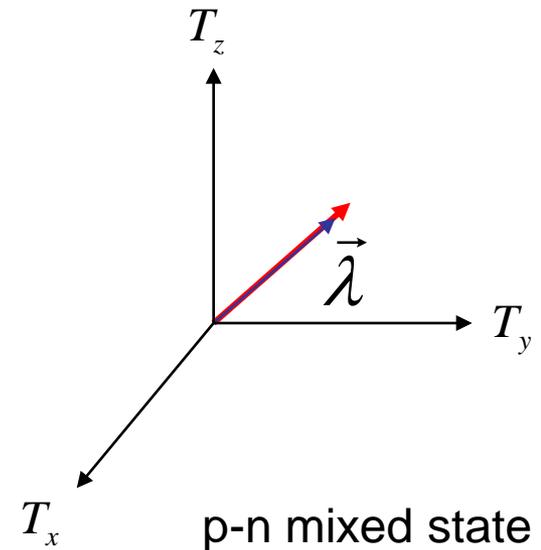

Determine s. t. proton and neutron Fermi energies become equal

$$-\vec{\lambda} \cdot \vec{T}$$

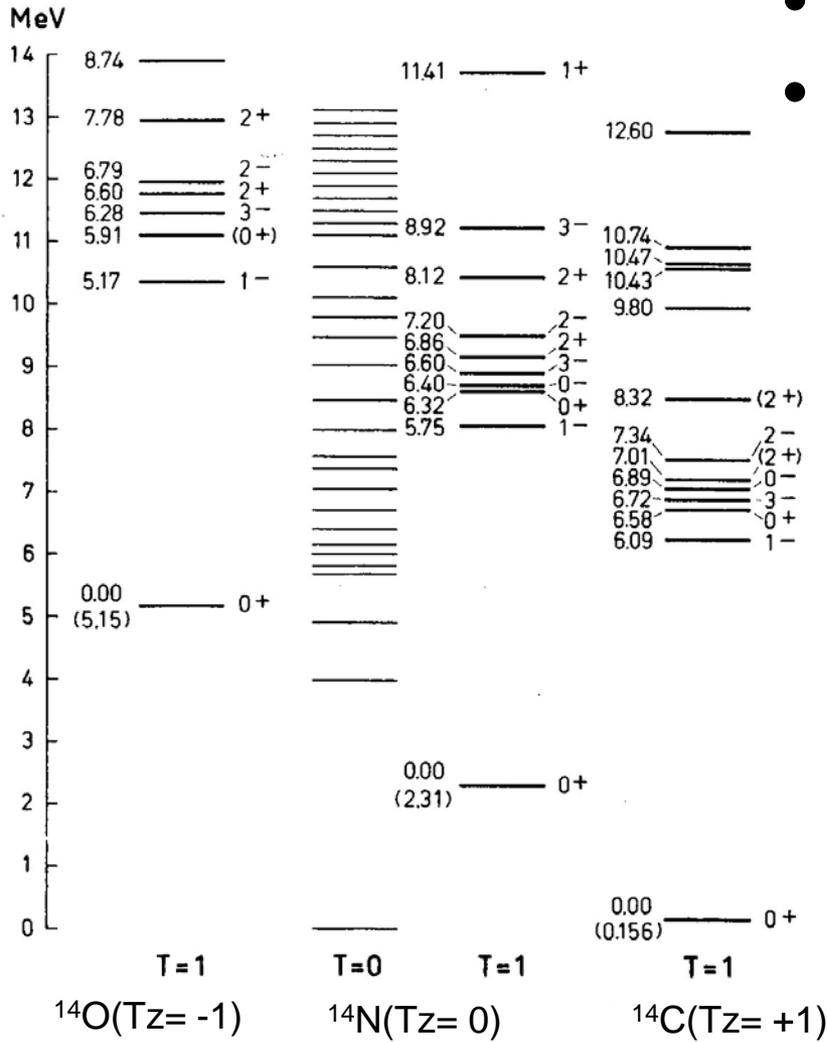

iteration

Final state

Calculation for A=14 isobars

- w/ p-n mixing and no Coulomb
- w/ p-n mixing and Coulomb

Isobaric symmetry

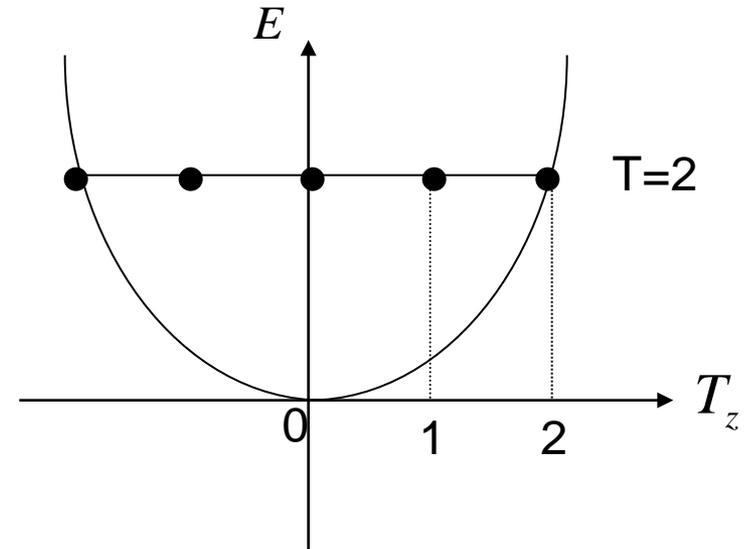

Figure 1-7 The level schemes for the nuclei with $A = 14$ are based on the compilation by F. Ajzenberg-Selove and T. Lauritsen, *Nuclear Phys.* **11**, 1 (1959), on the results given by D. E. Alburger, A. Gallmann, J. B. Nelson, J. T. Sample, and E. K. Warburton, *Phys. Rev.* **148**, 1050 (1966), and on a private communication by G. Ball and J. Cerny (August, 1966). The relative energies represent atomic masses.

every 15° of θ from 0 to 180°

Result for A=48 isobars

Initial : $^{48}\text{Cr}(T_z=0, T\sim 0)$

Without Coulomb

- ◇ Increase the size of isofrequency $|\vec{\lambda}|$ to make high-isospin states

With Coulomb

- ◇ Tune the size of lambda depending on the tilting angle θ
- ◇ Diabatic blocking with isospin to avoid oscillatory (ping-pong) divergence

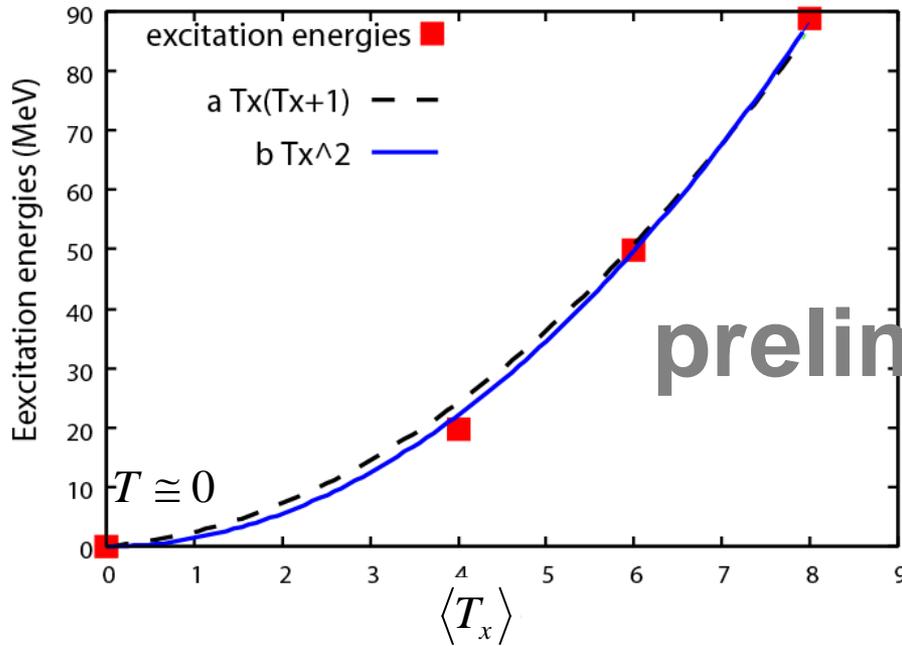

Constrained HF with Augmented Lagrange method

$$E' = E - \vec{\lambda} \cdot \hat{T} + C \left(\hat{T} - \bar{T} \right)^2$$

A. Staszczak, Eur. Phys. J. A **46**, 85–90 (2010)

Excitation energies for $^{48}\text{Cr}(T_z=0)$

constraints $T_z=0$ and $T_x=0,2,4,6,\dots$

--> nuclear symmetry energy

$$a = 1.20956 \text{ (MeV)}$$

$$b = 1.38078 \text{ (MeV)}$$

Sum of squared residuals :

$$a * T_x * (T_x + 1) \text{ fit} : 24.2$$

$$b * T_x^2 \text{ fit} : 6.1$$

Summary

We have developed a code for the DFT calculations with

- ✓ proton-neutron mixing at the Hartree-Fock level
- ✓ diabatic blocking method using isospin
- ✓ constraints on isospin with augmented Lagrange method

and performed test calculations for $A=14$ & 48 systems

Ongoing

- ◇ Isospin projection to remove spurious isospin mixing

W. Satuła et al., PRC 81, 054310 (2010).

Future

- ◇ Proton-neutron pairing ($T=0$ & $T=1$; non-rotating & rotating)
- ◇ Charge exchange reaction in neutron-rich nuclei (QRPA calculation)

A very wide applicability expected
